

# Obesity

## Focus on Weight Loss Medications

**Zeb Saeed, MD**

Center for Weight Management and Wellness  
Brigham and Women's Hospital

Instructor of Medicine  
Harvard Medical School

# Zeb Ijaz Saeed, MD

The Center for Weight Management and Wellness (CWMW) at Brigham and Women's Hospital offers comprehensive, multidisciplinary care for patients seeking treatment of their overweight and obesity. Dr. Zeb Ijaz Saeed is a board-certified obesity medicine specialist who is committed to advancing the care and outcomes of individuals living with obesity and diabetes.

Dr. Saeed has contributed to NIH-funded research focused on identifying novel biomarkers for diabetes secondary to acute and chronic pancreatitis and pancreatic cancer, as well as being involved in a study identifying new genetic causes of rare and atypical forms of diabetes. She is currently involved in clinical trials evaluating pharmacologic therapies aimed at improving cardiometabolic health in individuals with obesity and/or diabetes.

# Disclosures

- Research support (Site-PI) by Amylyx Pharmaceuticals, Kailera therapeutics and Eli Lilly.
- Advisory consultation completed with Sanofi

# Objectives

Upon completion, participants will be able to:

- Recognize obesity as a **chronic, multifactorial disease** with strong biological underpinnings.
- Review updated guidelines on the **classification** of obesity
- Understand the **pharmacologic options** for obesity management including oral and injectable options and **apply them to use in clinical practice**
- Analyze the **pleiotropic metabolic effects of nutrient-stimulated hormone (NuSH)** therapies and their implications for cardiometabolic health.

Obesity and Overweight is a  
multifactorial, biologically rooted  
disease with strong genetic  
underpinnings.

# Biology of Obesity - Genetics

- Obesity is not simply about willpower or lifestyle choices
- Chronic disease
- Complex interplay of genetics and environment
- Heritability: 40% and 70%

# Importance for recognition of biology of obesity

Awareness of weight bias and stigma:  
69% women with obesity report  
experiencing weight bias from doctors,  
and 52% from nurses.

People-first/people-centered language

Examples of Weight Bias and Stigma at Multiple Levels

Puhl RM, Phelan SM, Nadglowski J, Kyle TK. Overcoming Weight Bias in the Management of Patients With Diabetes and Obesity. Clin Diabetes. 2016 Raveendhara R Bannuru - Weight stigma and bias: standards of care in overweight and obesity—2025: BMJ Open Diabetes Research & Care 202;

# Updated Classification of Obesity

# BMI pitfalls

# New Proposed Definition of Obesity: BMI pitfalls

BMI may under and over diagnose obesity

## Measurements of body size

The commission defines three measurements of body size that can be used to confirm excess body fat:

**Waist circumference**  
≥102 cm for men\*  
≥88 cm for women\*

**Waist-to-hip ratio**  
>0.90 for men\*  
>0.85 for women\*

**Waist-to-height ratio**  
>0.50 for all\*

*Excess body fat can pragmatically be assumed if BMI is >40 kg/m<sup>2</sup>*

# Classification of Obesity

# Treatment of Obesity is multi-faceted, inter-disciplinary and longitudinal

# Pyramid of weight management

## Lifestyle modifications

No single dietary pattern superior

Key→ Consistency

**Mediterranean diet** : MASH and cardiovascular risk reduction

**DASH**: benefit for hypertension

**Exercise**: Mild weight loss.

150 -300mins of moderate-intensity aerobic exercise every week

**AND**

resistance training at least 2 sessions per week

# Anti-Obesity Medications

|                                   | BMI Category (kg/m <sup>2</sup> ) |                     |                      |                     |     |
|-----------------------------------|-----------------------------------|---------------------|----------------------|---------------------|-----|

# Phentermine Monotherapy

Approved by the FDA for **short term use** (up to 12 weeks) approved in children  $\geq 17$  years and adults

|                                 |                                                                                                                                                                                                                                   |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mechanism of action:            | Sympathomimetic --> NE and DA release in CNS → appetite suppression                                                                                                                                                               |
| Doses available:                | Long acting (once a day) <ul style="list-style-type: none"><li>- Capsules 15mg, 30mg, 37.5mg</li><li>- Tablets : 37.5mg</li></ul> Short acting (Three times a day) <ul style="list-style-type: none"><li>- Tablets: 8mg</li></ul> |
| Placebo-subtracted weight loss: | ~ 8% long term use.<br>TWL 10-12%                                                                                                                                                                                                 |
| Contraindications:              | Cardiovascular disease, uncontrolled hypertension, hyperthyroidism, anxiety/agitation, glaucoma, substance use disorder                                                                                                           |
| Side effects:                   | Dry mouth, insomnia, dizziness, irritability, increased blood pressure and heart rate                                                                                                                                             |
| Cost considerations:            | Cheap with coupons: \$10 -30 per month                                                                                                                                                                                            |

# Phentermine- Topiramate

FDA approved for long-term management of weight for adults and children 12 and older

|                      |                                                                                                                                                                                                                                                        |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mechanism of action: | Sympathomimetic→ NE release in hypothalamus→ Appetite suppression<br>Topiramate→ modulation of GABA receptors, carbonic anhydrase inhibitor and glutamate antagonist → affects satiety and changes taste sensation                                     |
| Doses available:     | 3.75 mg phentermine / 23 mg topiramate (initial dose only for 14 days)<br>7.5 mg phentermine / 46 mg topiramate (recommended dose)<br>11.25 mg phentermine / 69 mg topiramate (escalation dose)<br>15 mg phentermine / 92 mg topiramate (maximum dose) |
| Effectiveness:       | <b>CONQUER trial: 56 weeks Phase III RCT.</b> (-7.8% and -9.8% weight loss compared to -1.2% placebo ): -8.8% Placebo subtracted weight loss<br>5% weight loss : 62, 70 and 21%, respectively                                                          |
| Contraindications:   | CVD, glaucoma, hyperthyroidism, <b>teratogenic (reliable contraception)</b>                                                                                                                                                                            |
| Side effects:        | Dry mouth, paresthesia, constipation, insomnia, dizziness, and dysgeusia. Serious but less common side effects include mood changes, cognitive impairment, and increased heart rate. RTA and increased risk of renal stones (calcium phosphate)        |
| Cost considerations: | Expensive!! \$200-400 per month without insurance coverage                                                                                                                                                                                             |

# Bupropion-Naltrexone

FDA approved for long-term management of weight for age 17 and above, can help with smoking cessation

|                            |                                                                                                      |
|----------------------------|------------------------------------------------------------------------------------------------------|
| <b>Mechanism of action</b> | <b>Naltrexone, an opioid antagonist<br/>Bupropion, a norepinephrine-dopamine reuptake inhibitor.</b> |
| <b>Mode of delivery</b>    | Oral twice a day                                                                                     |
| <b>Effectiveness</b>       | Average weight loss of <b>5–6%</b> can be enhanced with intensive lifestyle intervention.            |
| <b>Contra indications:</b> | Chronic opioid use, uncontrolled hypertension, seizure disorder, anorexia or bulimia                 |
| <b>Side effects:</b>       | Nausea, constipation, headache, vomiting, increased blood pressure and heart rate                    |
| <b>Cost consideration</b>  | Expensive!! \$400-600 per month without insurance coverage                                           |

# Potential Actions of GIP and GLP-1

Based on Preclinical and Clinical Research

- GLP-1 Receptor Agonism
- GIP Receptor Agonism
- Indirect Action

## GLP-1 Receptor Agonism

### Central Nervous System

- ↑ Satiety
- ↓ Food Intake
- ↑ Nausea
- ↓ Body Weight

### Pancreas

- ↑ Insulin
- ↓ Glucagon

### Stomach

- ↓ Gastric Emptying

### Systemic

- ↓ **Hyperglycemia**

### Liver

- ↑ **Insulin Sensitivity**
- ↓ **Hepatic Glucose Production**
- ↓ **Ectopic Lipid Accumulation**

### Central Nervous System

### Central Nervous System

- ↓ Food intake
- ↓ Nausea
- ↓ Body weight
- ↑ Energy expenditure

### Pancreas

- ↑ Insulin
- ↑ Glucagon (glucose dependent)

### Subcutaneous White Adipose Tissue

- ↑ Insulin Sensitivity
- ↑ Lipid Buffering Capacity
- ↑ Blood Flow
- ↑ Storage Capacity
- ↓ Proinflammatory Immune Cell Infiltration

### Systemic

- ↓ **Hyperglycemia, Dietary Triglyceride**

### Skeletal Muscle

- ↑ **Insulin Sensitivity**
- ↑ **Metabolic Flexibility**
- ↓ **Ectopic Lipid Accumulation**

# Liraglutide

FDA approved children  $\geq 12$  years and adolescents, same dosing as adults

|                                 |                                                                                                        |
|---------------------------------|--------------------------------------------------------------------------------------------------------|
| Mechanism of action:            | GLP1-RA--> hypothalamic neurons--> increase satiety<br>Decrease gastric emptying → increase satiety    |
| Doses available:                | 0.6mg SQ QD x 1 week→ 1.2mg QD x 1 week→ 1.8mg QD x 1 week→ 2.4mg x 1 week→ 3mg QD thereafter          |
| Placebo-subtracted weight loss: | 4-5%<br>TWL : 8%                                                                                       |
| Contraindications:              | Personal or family history of medullary thyroid cancer or Type 2 Multiple Endocrine Neoplasia syndrome |
| Side effects:                   | Nausea, vomiting, bloating, fullness, diarrhea, constipation, dyspepsia, abdominal pain, fatigue       |
| Cost considerations:            | Expensive!! \$ 400-1000 per month without insurance coverage                                           |

# Semaglutide Injectable

FDA approved in children  $\geq 12$  years and adolescents and adults

FDA approved for reducing the risk of major adverse cardiovascular events in adults with established cardiovascular disease and obesity or overweight.

FDA approved for the treatment of adults with MASH (Metabolic Dysfunction–Associated Steatohepatitis) and fibrosis (stage F2–F3), without cirrhosis

|                      |                                                                                                                                                                                                                                                         |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mechanism of action: | GLP1-RA--> hypothalamic neurons→ increase satiety<br>Decrease gastric emptying → increase satiety                                                                                                                                                       |
| Doses available:     | 0.25mg SQ Q1W x 4 weeks → 0.5mg SQ Q1W x 4 weeks→ 1.0 mg SQ Q1W X 4 weeks<br>→ 1.7mg SQ Q1W x 4 weeks → 2.4 mg SQ Q1W ; can increase to <b>7.2mg SQ (STEP-UP trial)</b>                                                                                 |
| Effectiveness:       | Average weight loss 15-16% of body weight 2.4mg dose , 18.7% with 7.2mg dose<br>Placebo-subtracted weight loss: 11.9%                                                                                                                                   |
| Contraindications:   | Personal or family history of medullary thyroid cancer or Type 2 Multiple Endocrine Neoplasia syndrome                                                                                                                                                  |

# Semaglutide now approved in the US for MASH F2-F3 fibrosis

## ESSENCE trial

- Phase 3 Multi-Center RCT
- Semaglutide vs Placebo
- Biopsy-confirmed MASH and moderate to advanced fibrosis (stage F2 or F3) – 55.9% had T2D and mean BMI was 35
- **Primary Outcomes:**
  - Steatohepatitis resolution: 62.9% vs 34.3%
  - Fibrosis improvement: 36.8% vs 22.4%
- **Weight Loss**
  - 10.% vs 2.0% body weight reduction

| Subgroup                           | Semaglutide 2.4 mg (N) | Placebo (N) | EDP (95% CI)         | Semaglutide 2.4 mg Prop. responders | Placebo Prop. responders |

*\*Tirzepatide MTD is maximum tolerated dose of 10 mg or 15 mg once-weekly. The starting dose of 2.5 mg tirzepatide was increased by 2.5 mg every four weeks until maximum tolerated dose was achieved. Participants who tolerated 15 mg continued on 15 mg as their maximum tolerated dose. Participants who tolerated 10 mg but did not tolerate 15 mg continued on 10 mg as their maximum tolerated dose.*

Apnea-hypopnea index (AHI)

# Heart Failure Risk : Tirzepatide reduces worsening HF

- Tirzepatide: Reduced incidence of composite of adjudicated death from CV causes or a worsening HF event and quality of life and improved HF symptoms in people with obesity and HFpEF with or without T2D

- SUMMIT Trial
  - N= 731 (352 w T2D, 17% on baseline SGLT-2i)
  - Follow-up: 52 weeks
  - Study population: HFpEF EF $\geq$ 50 +/- T2D+ BMI  $\geq$  30
  - Primary outcome:
    - CV death or worsening HF event
    - Change in KCCQ score - Increased by 19.5 points vs 12.7 points in placebo

# Tirzepatide Diabetes Prevention: SURMOUNT-1 extension study

**Population:** 1032 adults with obesity/overweight + prediabetes

## Incidence of Diabetes

**Treatment duration:** 176 weeks + 17-week off-treatment follow-up

**Risk of progression to diabetes:**

**During treatment:**

→ HR 0.07 (93% lower risk)

**After stopping treatment:**

→ HR 0.12 (88% lower risk)

# SURMOUNT-5: Tirzepatide Superior to Semaglutide for Weight Loss

- Open-label RCT
- Adults with obesity but without diabetes
- 1:1 semaglutide or tirzepatide
- 72 weeks follow up

# Orforglipron

FDA approved for adults with obesity or overweight with  $\geq 1$  weight-related comorbidity.

|                                 |                                                                                                                                                                                                        |

| Mechanism of action:            | Small-molecule, non-peptide GLP-1 receptor agonist                                                                                                                                                     |
| Doses available:                | 0.8mg PO QD x 1 month → 2.5mg PO QD → 5.5mg PO QD → 9mg /14.5/17.2mg PO QD (maintenance doses)<br><b>Can be take with or without food</b><br><b>Max dose 9mg if taken with strong CYP3A4 inhibitor</b> |
| Placebo-subtracted weight loss: | 9.1%<br>TWL (Treatment-regimen estimand): 11.2%                                                                                                                                                        |
| Contraindications:              | Personal or family history of medullary thyroid cancer or Type 2 Multiple Endocrine Neoplasia syndrome                                                                                                 |
| Side effects:                   | Nausea, vomiting, bloating, fullness, diarrhea, constipation, dyspepsia, abdominal pain, fatigue                                                                                                       |
| Cost considerations:            | \$149-299/month without insurance coverage                                                                                                                                                             |

# ATTAIN-MAINTAIN

- Can patients who have already lost substantial weight on injectable incretins maintain that weight by switching to an oral GLP-1?
  - 52-week maintenance study: 376 participants from SURMOUNT-5
- Maintenance of  $\geq 80\%$  of body weight reduction

# Summary – Pleiotropic Effects

# Polling Question #1

A 52-year-old man with obesity (BMI 37 kg/m<sup>2</sup>) and moderate obstructive sleep apnea (AHI 18) presents to discuss treatment options. He has been unable to tolerate CPAP despite multiple attempts and is interested in pharmacologic therapy to improve both his weight and sleep apnea.

Which of the following obesity medications is currently FDA approved for the treatment of moderate-severe obstructive sleep apnea in adults with obesity?

# Polling Question #1

Which of the following obesity medications is currently FDA approved for the treatment of moderate-severe obstructive sleep apnea in adults with obesity?

- a) Phentermine-topiramate
- b) Oral Semaglutide
- c) Injectable Semaglutide
- d) Tirzepatide

# Polling Question #1

Which of the following obesity medications is currently FDA approved for the treatment of moderate-severe obstructive sleep apnea in adults with obesity?

- a) Phentermine-topiramate
- b) Oral Semaglutide
- c) Injectable Semaglutide
- d) **Tirzepatide**

# Prescribing Guide

# Prescribing AOMs- Person Centered Approach: PreClinical Obesity

- Behavioral counseling
- Healthy nutritional pattern
- Aerobic and muscle-strengthening activities
- Self-monitoring
- Avoid weight-promoting medications when possible

Follow up monthly for first 3 months to monitor and modify treatment, then every 3 months for first year.  
Continue long-term follow-up every 3–6 months.

**Goal: achievement and maintenance of weight reduction and prevention of obesity-related diseases and complications**

Without related diseases or complications

**Weight-reducing effect of obesity medication beyond 3% weight loss with lifestyle change alone\***

**High (>10%)**

Tirzepatide (A)  
Semaglutide (A)

**Moderate (5–10%)**

Phentermine-topiramate (A)

**Modest (<5%)**

Naltrexone-bupropion (A)  
Liraglutide (A)  
Phentermine (C)†  
Orlistat (A)

**Select obesity medication that aligns with individual goals and does not present barriers to its long-term use‡**

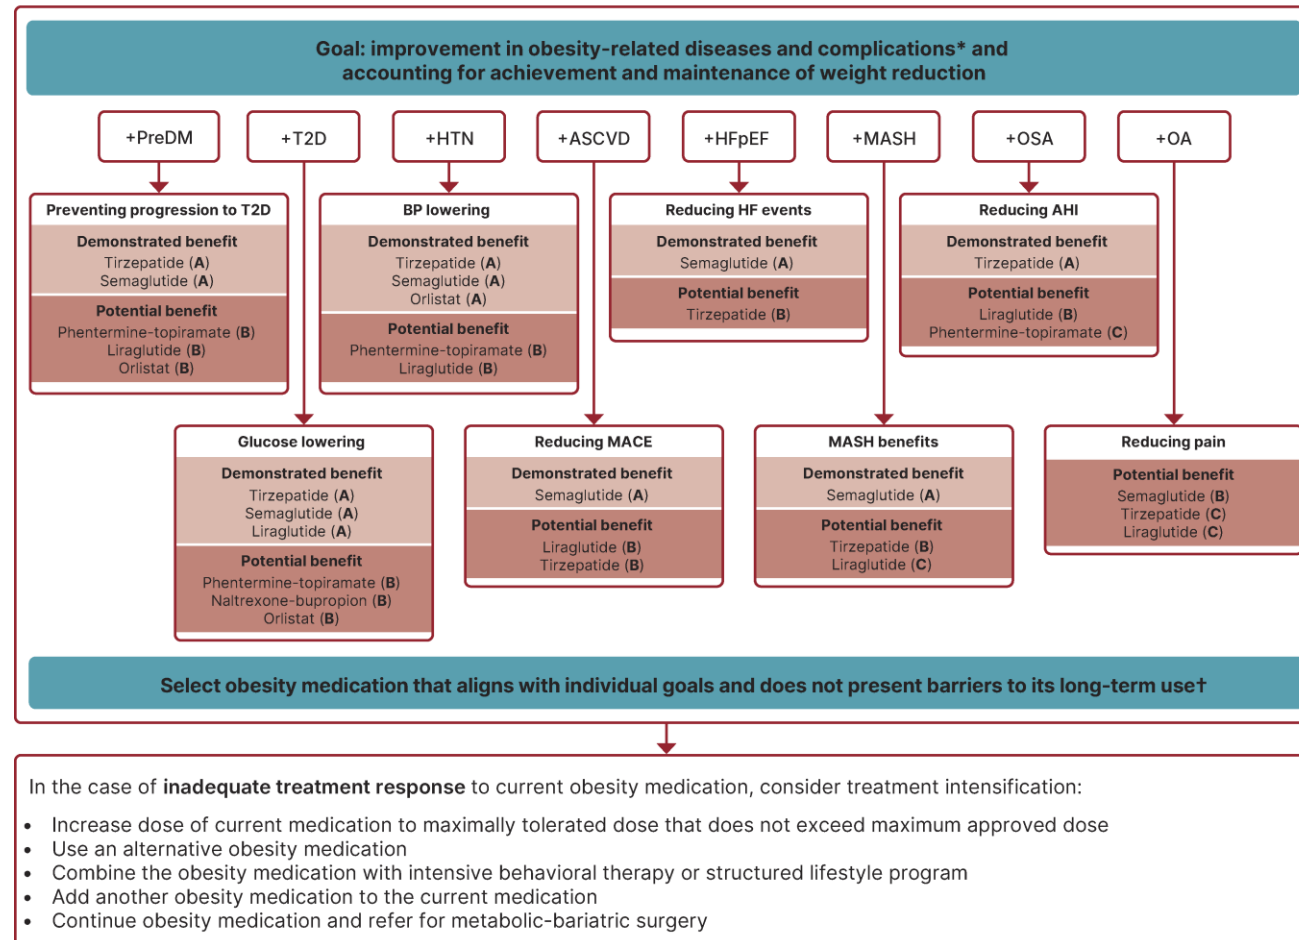

In the case of **inadequate treatment response** to current obesity medication, consider treatment intensification:

- Increase dose of current medication to maximally tolerated dose that does not exceed maximum approved dose
- Use an alternative obesity medication
- Combine the obesity medication with intensive behavioral therapy or structured lifestyle program
- Add another obesity medication to the current medication
- Continue obesity medication and refer for metabolic-bariatric surgery

# Prescribing AOMs- Person Centered Approach: Clinical Obesity

- Behavioral counseling
- Healthy nutritional pattern
- Aerobic and muscle-strengthening activities
- Self-monitoring
- Avoid weight-promoting medications when possible

Follow up monthly for first 3 months to monitor and modify treatment, then every 3 months for first year.  
Continue long-term follow-up every 3–6 months.

# Injectable Semaglutide Titration

# Tirzepatide Titration

**Starting**  
For 4 weeks

For 4+ weeks

For 4+ weeks

For 4+ weeks

For 4+ weeks

Maximum dose

# Oral Semaglutide Titration

**Take once daily on an empty stomach with up to 120 mL (4 oz) of plain water.**  
Wait ≥30 minutes before eating, drinking, or taking other oral medications.  
Swallow tablet whole.

\* If patients do not tolerate a dose during escalation, consider delaying dose escalation.

# Orforglipron Titration

# SIDE EFFECTS for GLP-1RAs

# Mitigating Side Effects

- **START LOW AND GO SLOW**
- Nausea most frequent side effect
- Prevalence highest during first 4-5 weeks of treatment
  - Gastric emptying also slowest
  - Last 8 days from onset
- Constipation - onset in first 16 weeks
  - may last longer than other GI SEs

# Effectively Managing GI side effects

# Tips to navigate GLP1RA and GIP/GLP1RA shortages

Switch as needed

## Low Potency

- Liraglutide 0.6 mg
- ORAL Semaglutide 1.5mg

## Medium Potency (Level1)

- Liraglutide 1.2 mg
- Semaglutide 0.25 mg
- ORAL semaglutide 4 mg

## Medium Potency (Level 2)

- Liraglutide 1.8 mg
- Semaglutide 0.5 mg
- Tirzepatide 2.5 mg
- Oral Semaglutide 9 mg

## High Potency

- Liraglutide 2.4 mg and 3 mg
- Semaglutide 1.7mg
- Tirzepatide 5 mg
- Oral Semaglutide 9 mg

## Very High Potency

- Semaglutide 2.4 mg
- Tirzepatide 7.5 and 10 mg
- Oral Semaglutide 25mg

## Highest Potency

- Tirzepatide 12.5 mg and 15mg

## Polling Question #2

Mrs. X comes to you for follow-up of her weight management. She started semaglutide for weight loss 1 year ago and initially her weight went down from 190lbs to 150lbs in the first six months, but she has not lost any weight since then. She is on maximum dose of injectable semaglutide 2.4mg weekly. Her current BMI is 26. She has no other chronic medical conditions. She is asking you if she can come off semaglutide since “it’s no longer working”.

What do you do?

## Polling Question #2

She is asking you if she can come off semaglutide since “it’s no longer working”. What do you do?

- a) Continue semaglutide
- b) Slowly wean off semaglutide
- c) Stop semaglutide now

## Polling Question #2

She is asking you if she can come off semaglutide since “it’s no longer working”. What do you do?

- a) **Continue semaglutide**
- b) Slowly wean off semaglutide
- c) Stop semaglutide now

# Pipeline

# Newer drugs in the pipeline

# MOC Reflective Statement

- Obesity is a **chronic**, relapsing, **serious** but **treatable medical condition** with strong genetic predisposition that has been under-treated and wrongly attributed to personal lifestyle choices alone for too long (and still is).
- We need to change the way medicine is practiced by empowering primary care providers to treat obesity
- Treat obesity early using a **person-centered, complication-based approach** rather than BMI alone.
- New-generation therapies (injectable and oral) now produce **double-digit weight loss** with meaningful improvements in cardiovascular, metabolic, liver, sleep apnea, and heart failure outcomes.
- Many Nutrient-stimulated Hormonal therapies (NuSH) in development
